INDEX
CHAPTER 1: INTRODUCTION

The Aerotech DS8020 Servo Amplifier marks an advance in brush DC motor power control technology. High output power, small size, and standardized mounting (standard 160 mm, 3U Euro-card) make this Servo Amplifier one of the most versatile on the market today. A photo of the DS8020 Servo Amplifier is shown in Figure 2-1.

The DS8020 utilizes a patented PWM drive scheme allowing it to provide high output power at very high efficiency. The DS8020 has a nominal rating of 80 VDC at 20 amps peak (2 seconds), 10 amps continuous (with fan cooling), 5 amps continuous (without fan) at up to a 50 degree C ambient. The patented drive scheme allows operation between 0 and 80 VDC bus levels without component adjustments. A motor output load fuse is provided.

The PWM output switching frequency is 20 KHz, well above the audible frequency range. The PWM output stage utilizes hermetically sealed power MOSFET switching devices, providing very high reliability and long life.

Five potentiometers are provided at the front of the DS8020 for easy access when adjusting the input and tach feedback gain, balance, and current limit. A parameter adjustment module known as the "personality module" provides a means of modifying all gain and current limit adjustment parameters usually adjusted with the potentiometers. The user may set predetermined gains and current limits and may match specific DC motors to the DS8020 without adjusting the potentiometers themselves.

The DS8020 is self-contained, except for the user supplied AC voltage source needed to generate the internal DC bus voltage of 0 to 80
VDC, and \pm 12 VDC control voltages. Motor load short circuit protection is provided internally. A typical interconnection diagram for wiring two or more DS8020 Servo Amplifiers into a system is shown in Figure 2-8.

Aerotech provides two types of integrated power supply mounting racks for the DS8020: the DSFR and the DSHR.

The three-axis mounting rack (DSHR) is shown in Figure 3-1. The six-axis mounting rack (DSFR) is shown in Figure 3-2. Both mounting racks have totally integrated DC bus and control power supplies. Shunt regulators for controlling DC bus motor regeneration and isolation transformers to supply power to the DC bus may be supplied as an option for both mounting racks.

Both mounting racks provide easy termination of control and power connections to the Motion Controller and DC motors. These mounting racks are designed for panel mounting, reversing the mounting flanges on the six-axis DSFR rack, will permit 19\" rack mounting.

The major difference between the DSHR rack and DSFR rack is the inherent mounting hardware. The six axis DSFR rack is, in actuality, two three-axis DSHR racks joined together. The six-axis DSFR rack contains two separate three-axis power supplies, each identical to the power supply on the three-axis DSHR mounting rack.

All mounting rack specifications listed in Chapter 3, except those specifying dimensional data, are in reference to the three-axis DSHR mounting rack.
CHAPTER 2: DS8020 SERVO MODULE

The DS8020 Servo Amplifier is shown in Figure 2-1 and Figure 2-2A. Also shown in these figures are the various locations for potentiometer adjustments, the personality module (labeled RCN4), the motor load fuse, and the pin-out specification for the main control and power connector J1 (located at the rear of the unit). Details of the various items are included in this Chapter.

SECTION 2-1 MOUNTING SPECIFICATIONS

The DS8020 is designed to "slide" into any standard 3U or partitioned 6U user-supplied card rack. (Integrated power supply 3U card racks for the DS8020 can be supplied by Aerotech. See Chapter 3 for details.)

A sampling of 3U/6U card rack manufactures are listed below.

BICC-VERO
40 Lindeman Drive
Trumbull, CT 06611 (USA)

SCHROFF
179 Commerce Drive
Warwick, R.I. 02886 (USA)

KNURR AG
(USA Representative)
Panel Components Corp.
335 Tesconi Circle
Santa Rosa, CA 95406
A. Mounting holes as per DIN 41612 specifications
B. .25" quick-connect lugs (typical)

Figure 2-2B: Outline of "Quick-Connect" Mating Connector for Connector J1 of DS8020
If the user desires the DS8020 be integrated into a user designed PC "mother board" (DIN mounting specification 41617), a different connector, designed for PC board mounting, must be used. Aerotech will supply this connector as an option (P/N ECK352), or the user may purchase this connector independantly. One supplier of this mating connector in the U.S.A. is:

SCHROFF
179 Commerce Drive
Warwick, R.I. 02886

SECTION 2-3 ELECTRICAL SPECIFICATIONS

Electrical specifications for the DS8020 are listed in Table 2-1. Each specification refers to corresponding J1 connector pin numbers, and to figure numbers containing additional information.

A block diagram of the DS8020 Servo Amplifier module is shown in Figure 2-3. All input and output power and control connections are passed through connector J1 (see also Figure 2-2A).

Two control sections (pre-amplifier and post-amplifier, in dotted lines) are shown in Figure 2-3. Each of these control sections are detailed in subsequent Figures 2-4 and 2-7.

SECTION 2-4 FAULT OUTPUT

The DS8020 Servo Amplifier Module when equipped with the DS Series motherboard is configured with a Fault Output of active low. If the DS8020 Servo Amplifier is not equipped with the DS Series motherboard and the motherboard is to be user supplied the Servo Amplifier Module may be selectively configured for a Fault Output of active high. This is accomplished by removing the Fault Output Select
jumper (see Figure 2-3) from JP 1-2 and connecting the jumper to JP 2-3.

**NOTE:** The active high Fault Output must not be used in conjunction with the DS Series motherboard.

**SECTION 2-5 PERSONALITY MODULE**

The Personality Module pre-amplifier circuit, RCN4, (shown in Figure 2-4) is used to interface input and tach feedback signals (if any exist). Figure 2-2A shows the location of this module.

This module may be reconfigured by the user. An outline of the module is shown in Figure 2-6.

**SECTION 2-6 CONTROL MODES**

The input speed command, Vcom, (Refer to Figure 2-4) is usually connected to the output command signal of the Motion Controller through J1, pin 16. The motor tachometer feedback connection Vfb is then connected to J1, pin 18. The component values of RCN4 are set to those values depicted in Figure 2-4.

Modern motion controllers often provide tach feedback internally to the control. The result is that the output control signal from the motion controller is usually a current command signal rather than the traditional speed command signal described above.

For this control mode, the tach connection (pin 18 of J1) remains open. The current command signal is brought into pin 16 of J1. In this case, personality module RCN4 is usually reconfigured for unity gain by shorting RCN4 12 to 5, and replacing RCN4 10 to 7 with a 10K ohm resistor. The input and tach potentiometer positions are set full CW.
Figure 2-3: Simplified Block Diagram of the DS8020 Servo Amplifier Module

- **Input/Output Transfer Convention (Open Loop)**
  A plus (+) voltage on either input or tach with respect to signal common, produces a net plus (+) voltage on motor connection 30 with respect to motor connection 26

- **Patent No. 4,554,512**
  on Driver/Receiver A and B

*** Connect JP1 and JP2 for active low fault output. Connect JP2 and JP3 for active high fault output. NOTE: Active high fault output must not be used with the DS Series motherboard.
Figure 2-4: Detailed Electrical Diagram of DS8020 Pre-Amplifier Circuit (actual circuit)
CHAPTER 2: DS8020 SERVO MODULE

SECTION 2-7 SETTING THE CURRENT LIMIT

The RCN4 resistor component 8-9 is used to set the maximum current that can be obtained by the current limit potentiometer (full CW for zero current, full CCW for maximum current). The resistor value for RCN4&-9, however, must not be less than 3.9K ohms or the maximum clamp level of 20 amps will be exceeded. Alternate maximum current clamp levels less than 20 amps can be selected by using the following equation.

\[
\text{MAX. CURRENT CLAMP (Amps)} = \frac{180000}{5000 + \text{RCN4}&-9} \quad (\text{RCN4}&-9 \text{ in ohms})
\]

The resistor is factory set for 3.9K (20 amps maximum).

SECTION 2-8 PRE-AMPLIFIER GAIN CHARACTERISTICS

The open loop transfer function for the input connection Vcom (pin 16, J1) and tach feedback connection Vfb (pin 18, J1) to internal current command signal, Icom, is shown in Figure 2-5. The gain curves shown in Figure 2-5 are in relation to the values of RCN4 shown in Figure 2-4.
SECTION 2-9 THE POST-AMPLIFIER

A detailed circuit description of the post-amplifier (shown by dotted lines in Figure 2-3) is outlined in Figure 2-7. (The circuitry shown in Figure 2-7 is for reference only and is not intended to be altered by the user.)

Figure 2-7 shows the control relationships of the internal current command, Icom, with the internal current feedback signal, Ifb, (see also Figures 2-3 and 2-4). A brief outline of the PWM circuit, used to control the MOSFET switches of the output power stage, is also shown in this figure.

SECTION 2-10 WIRING DS8020 INTO A SYSTEM

A typical user interconnect wiring diagram for two DS8020s operating from a common DC bus and ±12 VDC control supply is shown in Figure 2-8.

Exercise caution when wiring the DS8020 servo amplifiers to the DC bus and control power supplies.

Most important of the wiring considerations is the length of the interconnect wiring between the DC bus power supply and connector J1, pins 28 and 32 of the DS8020. This interconnect wiring must never exceed 18 inches (0.45 meter) between these two points (see Figure 2-8). Also, the interconnect wiring between the DC bus and pins 28 and 32 must be twisted tightly together and be of no less than #14 AWG gauge (21x10⁻³ CM²).

CAUTION: FAILURE TO OBSERVE THE CONSIDERATIONS LISTED ABOVE MAY RESULT IN PERMANENT DAMAGE TO THE POWER STAGE OF THE DS8020
NOTE: TRANSFER FUNCTIONS SHOWN ABOVE ARE WITH RESPECT TO VALUES OF RCN4 SHOWN IN FIGURE 2-4.

Figure 2-5: Transfer Function of Pre-Amplifier Circuit
Figure 2-6: Outline of Personality Module RCN4
Figure 2-7: Detailed Electrical Diagram of DS8020 Post-Amplifier Circuit
The DC bus filter capacitor (labeled "C" in Figure 2-8) must be no smaller than 3000 μF for each DS8020 connected to the bus, and must be of computer grade electrolytic type. Each of the DC bus interconnect twisted wire pair that connects to pins 28 and 32 of J1 on each DS8020 amplifier, should be run separately to the DC bus filter capacitor(s). This wiring technique eliminates potential control signal "cross talk" between two or more DS8020 wired to the same DC bus power supply.

Connect the "signal common" (pin 4 and/or 24 of J1) of each DS8020 to the "+ B RETURN" point of the DC bus as shown in Figure 2-8. Connect earth ground to the "+ B RETURN" point as shown.

The potential between the signal common (pin 24 of J1) and + B RETURN (pin 32 of J1) must never exceed ±4 volts as specified in Table 2-1. A 100 ohm impedance separates these two points. This impedance is used to minimize "ground loop" effects on the control stage of the DS8020 amplifier. For best results, these points should always be tied together and referenced to earth ground at + B Return terminal (see Figure 2-8).
Figure 2-8: Wiring Diagram for One or More DS8020 Servo Modules When Not Used with the Optional DSHR or DSFR Mounting Racks
SECTION 2-11 TROUBLESHOOTING THE DS8020

A troubleshooting guide for the DS8020 Servo Amplifier module is provided in Table 2-2.

A. DS8020 SPARE PARTS

A list of recommended spare parts for the DS8020 Servo Amplifier module is shown in Table 2-3.

Table 2-1, Electrical Specifications, is listed on this and the following pages.

### DS8020 TROUBLESHOOTING GUIDE (Table 2-2)

#### CONDITION

**Active LED is deenergized, even with ±12 VDC applied to pins 20 and 22 of J1.**

- Shutdown input (pin 6, J1) is pulled low.
- High DC bus voltage (pins 28, 32 of J1)
- ±12 VDC input (pin 20, J1) is below +11 VDC
- Short circuit exists at motor connections (pin 26, 30 of J1)

**Active LED is energized, but no torque is present at motor shaft.**

- Motor load fuse F1 is open.
- I limit + (pin 12, J1) and/or I limit - (pin 14, J1) contact closed to signal common.
- No DC bus voltage on +B, +B Return (pins 28, 32 of J1)
- Current limit pot turned full CW.

**Motor accelerated to full speed when ±12 VDC power and DC bus power is applied.**

- Tach feedback wires reversed (pin 18, 24 of J1)

---

CHAPTER 2: DS8020 SERVO MODULE

- Personality module removed
- Motor has high pitch (oscillation) sound when ±12 VDC and DC bus power is applied
- Tach and/or gain pot turned too high
- Motor gets excessively hot when running at minimum load condition (reference current monitor, pin 8 of J1)
- Ripple current (peak to peak) in excess of 20% of continuous return of motor, due to too high pre-amplifier gains.
- Ripple current (peak to peak) in excess of 20% of continuous rating of motor, due to too low motor inductance.

CHAPTER 3: DSFR AND DSHR MOUNTING RACKS

Two types of mounting racks for the DS8020 Servo Amplifier module may be supplied as an option. Figures 3-1 and 3-2 contain photographs of these racks.

SECTION 3-1 THREE-AXIS MOUNTING RACK (DSHR)

The three-axis mounting rack (DSHR) shown in Figure 3-1 contains all necessary functions for interfacing up to three DS8020 Servo Modules with three DC motors. The only additional item necessary is a transformer for generating power for the internal DC bus power supply.

A 1.5 KVA transformer is usually all that is necessary for driving up to three DS8020 amplifiers in a typical servo application.

The control voltages (±12 VDC supply) are derived internally from an external 115/230 VAC, 50 to 400Hz power source.

SECTION 3-2 SHUNT REGULATOR OPTION

An optional DC bus shunt regulator circuit (integral to the mounting rack) may be supplied to clamp an elevated DC bus voltage caused by excess motor power regeneration during deceleration.
SECTION 3-3 CONTROL & POWER TO MOUNTING RACKS

Control and power connections to the mounting rack are accessed via an extension board at the rear of the mounting rack. The mounting rack base height is 3U, in accordance with international DIN standards. The control and power extension board is less than 1U in additional height.

Figure 3-1: Photograph of Three-Axis Mounting Rack (DSHR)
SECTION 3-4  SIX AXIS MOUNTING RACK (DSFR)

The six-axis mounting rack (DSFR) is shown in Figure 3-2. This rack consists of two three-axis racks joined together.

Thus, for purposes of simplification, this Chapter provides only those specifications that are pertinent to the three-axis rack. Specifications for the six-axis rack are provided only for those specific items that differ from the three-axis version.

SECTION 3-5  MOUNTING SPECIFICATIONS (DSHR/DSFR)

Mounting specifications for the DSHR and DSFR mounting racks are shown in Figure 3-3.

Refer to additional dimensions for fans shown in Figure 3-4, if optional fan cooling is required. (P/N BA1 for DSHR and P/N BA2 for DSFR.) Fans are required for the DS8020 Servo Amplifiers when continuous current greater than 5 amps is required.

WARNING: Adequate ventilation space must be provided above and below the mounting rack for adequate convection cooling of the DS8020 amplifiers. This requirement is applicable to units with or without optional fan cooling. (See Figure 3-4 for minimum air flow space.)

A side view of the DSFR and DSHR mounting racks is shown in Figure 3-5. The sides of both mounting racks can be reversed in the field by removing the eight screws as shown. This feature allows for field selectable panel mounting or rack mounting. The DSFR (six-axis) mounting rack is the standard 19" width allowing it to be panel mounted or rack mounted.
Figure 3-2: Photograph of Six-Axis Mounting Rack (DSFR)
Chapter 3: DSFR and DSHR Mounting Racks

Figure 3-3: DSHR and DSFR Mounting Dimensions
Figure 3-4: DSHR and DSFR Fan Option Dimensions
SECTION 3-6 ELECTRICAL SPECIFICATIONS-DSFR/DSHR

Electrical specifications for the DSFR and DSHR mounting racks are listed in Table 3-1. Each specification listed in Table 3-1 contains reference information regarding input/output connector pin numbers, and additional Figure numbers contained in this Chapter. Comments are also included for each specification.

An outline of the DSHR (three-axis) mounting rack is shown in Figure 3-6. This outline provides reference information for user terminated input and output control and power wiring.

A rear view of the DSHR rack is shown in Figure 3-7. This outline shows the location of the shunt regulator fuse (for Shunt Regulator option).

SECTION 3-7 FUNCTIONAL DIAGRAM-DSHR/DSFR

A functional diagram of the DSHR mounting rack is shown in Figure 3-8. Locations of input and output connectors J1 through J4 are shown in Figure 3-6.

Pertinent information concerning the locations of key items shown in the function diagram (Figure 3-8) are shown in Figure 3-9.

DANGER: HIGH VOLTAGE EXISTS ON THE REAR OF THE DS SERIES MOTHER BOARD.
Mounting ears can be reversed for rack or panel mounting by removing screws (both sides).

Mounting ear in front when rack mounted.

Mounting ear in rear when panel mounted.

Figure 3-5: Side View of DSFR or DSHR Mounting Rack

Figure 3-9: Inside View Of DSHR Mounting Rack (DS8020 Servo Amplifier And Power Supply Module Removed)
CHAPTER 3: DSFR AND DSHR MOUNTING RACKS

SECTION 3-8 WIRING DSFR/DSHR INTO SYSTEM

An interconnect diagram for input power and output motor wiring is shown in Figure 3-10. The input DC bus power wiring (J1) allows for two configurations, single-phase full wave or single-phase center tap. The internally generated DC bus voltage relationship to input AC voltage can be derived with the following equation (this equation applies to both center tap and non-center tap configurations).

\[ \text{DC BUS (VDC)} = \text{INPUT VAC RMS} \times 1.414 \]

NOTE: Connections J1 pin 4 and J3 pin 7 must both be connected to earth ground. (See Figure 3-10.)

An outline and pin-out specification for the control interface connector (J3) is shown in Figure 3-11. Connector J3 accommodates a standard 37 pin "D" type male mate.

SECTION 3-9 THE TV 1.5 DC BUS POWER TRANSFORMER

An outline of the optional TV 1.5 DC bus power supply transformer (P/N EAX141) is shown in Figure 3-12. This transformer is supplied as an option to the DSFR and DSHR mounting racks. The transformer allows the generation of a 40 VDC bus (28 VAC taps), 60 VDC bus (42 VAC taps), and 80 VDC (56 VAC taps).

Figure 3-13 shows the typical DC Bus "droop" characteristics of the TV 1.5 transformer, connected to the DC bus input power connection (J1) of the DSHR rack (see Figure 3-10). DC bus voltage level V₀ of Figure 3-13 is in respect to the filter capacitors \((9000\mu\text{f} \times 2)\) with given value of output current I₀ distributed to the three DS8020 Servo Amplifier modules.
SECTION 3-10 TROUBLESHOOTING THE DSHR & DSFR

A troubleshooting guide for the DSFR and DSHR mounting racks is shown in Table 3-2 (located at the end of this Chapter).

SECTION 3-11 DSHR & DSFR SPARE PARTS

A list of spare parts for the DSFR and DSHR mounting racks is shown in Table 3-3 (located at the end of this Chapter).

## TROUBLESHOOTING THE DSHR AND DSFR

### Table 3-2

<table>
<thead>
<tr>
<th>CONDITION</th>
<th>POSSIBLE CAUSE</th>
<th>REFERENCE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active LED(s) on DS8020 servo are de-energized with 115 (230) VAC applied at connector J2.</td>
<td>• Shutdown inputs (pins 4, 10, 16 of J3) are pulled to signal common.</td>
<td>• See Figure 3-8, 3-11 (see also Tables 3-1, Control Interface Specifications).</td>
</tr>
<tr>
<td></td>
<td>• 115 (230) VAC control input power below minimum level.</td>
<td>• See Figure 3-8, 3-10 (see also Table 3-1, Control Interface Specifications).</td>
</tr>
<tr>
<td></td>
<td>• Motor short circuit condition at motor output power connections (pin 1 through 6 on J4).</td>
<td>• See Figure 3-8, 3-10</td>
</tr>
<tr>
<td></td>
<td>• ±12 VDC power supply fuse F2 open</td>
<td>• See Figure 3-8, 3-9, (NOTE: If fuse is open, do not attempt repair!)</td>
</tr>
</tbody>
</table>

Active LED(s) on DS8020 servo module(s) are energized, but no torque is present on motor shaft.

- Directional current limit contacts (l limit + and l limit- : pins 6, 12, 18, 25, 31 and 37 of J3) are pulled to signal common.
- Current limit pots on DS8020 servo module are full CW.
- No DC bus input voltage (J1) or input DC bus fuse open.

Motor(s) accelerate to full speed when ±12VDC power (J2) DC bus power (J1) is applied.

- Tach feedback connected (pin 21, 27, 33 of J3) are required with respect to signal common.

---

Table 3-2: DSHR and DSFR Mounting Rack Troubleshooting Guide
CHAPTER 3: DSFR AND DSHR MOUNTING RACKS

DC bus shunt regulator fuse opens periodically (shunt regulator option).

- Excessive motor regeneration (due to deceleration of high inertia load).
- DC input power greater than 56 VAC

Fault LED is energized.

- Shunt regulator fuse is open (shunt option).
- One or more DS8020(s) have short circuit current trip condition at motor output connections (J4).
- DC bus voltage in excess of 95 VDC (no shunt regulator option).

- See Figure 3-7, 3-8 (see also Table 3-1, Input/Output DC Bus Power Specifications).
- See Figure 3-8, 3-10 (see also Table 3-1).
- See Figure 3-7, 3-8.
- See Figure 3-8, 3-10

*Table 3-3: DSFR and DSHR Replacement Parts List*
On-site service should be performed by an experienced Aerotech-trained technician.

**WARNING:** WHILE UNDER WARRANTY, CUSTOMER REPAIR OF THE EQUIPMENT SHOULD NOT BE ATTEMPTED, TO DO SO MAY VOID THE WARRANTY.

When calling for service, PLEASE HAVE THE EQUIPMENT SERIAL NUMBER AVAILABLE.

**SECTION 4-1 SHIPMENT**

The procedure for shipping equipment back to Aerotech described below, pertains to warranty as well as non-warranty repairs.

1. Before returning any equipment a "Return Authorization Number" must be obtained from Aerotech. *Have the equipment serial number available when calling.*

2. The equipment being returned must be encased in a proper cushioning material and enclosed in a cardboard box.
Warning: Damage due to improper packaging voids warranty!

Aerotech Service Centers are listed below. For service and information, contact the office servicing your area.

Warranty and Field Service Policy

Aerotech, Inc. warrants its products to be free from defects caused by faulty materials or poor workmanship for a minimum period of one year from date of shipment from Aerotech. Aerotech’s liability is limited to replacing, repairing or issuing credit, at its option, for any products which are returned by the original purchaser during the warranty period. Aerotech makes no warranty that its products are fit for the use or purpose to which they may be put by the buyer, whether or not such use or purpose has been disclosed to Aerotech in specifications or drawings previously or subsequently provided, or whether or not Aerotech’s products are specifically designed and/or manufactured for buyer’s use or purpose. Aerotech’s liability on any claim for loss or damage arising out of the sale, resale or use of any of its products shall in no event exceed the selling price of the unit.

Laser Product Warranty

Aerotech, Inc. warrants its laser products to the original purchaser for a minimum period of one year from date of shipment. This warranty covers defects in workmanship and material and is voided for all laser power supplies, plasma tubes and laser systems subject to electrical or physical abuse, tampering (such as opening the housing or removal of the serial tag) or improper operation as determined by Aerotech. This warranty is also voided for failure to comply with Aerotech’s return procedures.

Returned Product Non-Warranty Determination

After Aerotech’s examination, the buyer shall be notified of the repair cost. At such time the buyer must issue a valid purchase order to cover the cost of the repair and freight, or authorize the product(s) to be shipped back as is, at the buyer’s expense. Failure to obtain a purchase order number or approval within (30) days of notification will result in the product(s) being returned as is, at the buyer’s expense. Repair work is warranted for (90) days from date of shipment. Replacement components are warranted for one year from date of shipment.

Rush Service

At times, the buyer may desire to expedite a repair. Regardless of warranty or out-of-warranty status, the buyer must issue a valid purchase order to cover the added rush service cost. Rush service is subject to Aerotech’s approval.

On-Site Warranty Repair

If an Aerotech product cannot be made functional by telephone assistance or by sending and having the customer install replacement parts, and cannot be returned to the Aerotech service center for repair, and if Aerotech determines the problem could be warranty-related, then the following policy applies.

Aerotech will provide an on-site field service representative in a reasonable amount of time, provided that the customer issues a valid purchase order to Aerotech covering all transportation and subsistence costs. For warranty field repairs, the customer will not be charged for the cost of labor and material. If service is rendered at times other than normal work periods, then special service rates apply.

If during the on-site repair it is determined the problem is not warranty related, then the terms and conditions stated in the following “On-Site Non-Warranty Repair” section apply.

On-Site Non-Warranty Repair

If an Aerotech product cannot be made functional by telephone assistance or purchased replacement parts, and cannot be returned to the Aerotech service center for repair, then the following field service policy applies.

Aerotech will provide an on-site field service representative in a reasonable amount of time, provided that the customer issues a valid purchase order to Aerotech covering all transportation and subsistence costs and the prevailing labor cost, including travel time, necessary to complete the repair.
