Global Technical Support

Go to [www.aerotech.com/global-technical-support](http://www.aerotech.com/global-technical-support) for information and support about your Aerotech, Inc. products. The website supplies software, product manuals, Help files, training schedules, and PC-to-PC remote technical support. If necessary, you can complete Product Return (RMA) forms and get information about repairs and spare or replacement parts. To get help immediately, contact a service office or your sales representative. Include your customer order number in your email or have it available before you call.

Safety Procedures and Warnings

Read this manual in its entirety before installing, operating, or servicing this product. If you do not understand the information contained herein, contact an Aerotech representative before proceeding. Strictly adhere to the statements given in this section and other handling, use, and operational information given throughout the manual to avoid injury to you and damage to the equipment.

The following statements apply wherever the Warning or Danger symbol appears within this manual. Failure to observe these precautions could result in serious injury to those individuals performing the procedures and/or damage to the equipment. Operators should be trained before operating this equipment.

**DANGER**: This product contains potentially lethal voltages. To reduce the possibility of electrical shock, bodily injury, or death the following precautions must be followed.

1. Access to the ATS150 and component parts must be restricted while connected to a power source.
2. Do not connect or disconnect any electrical components or connecting cables while connected to a power source.
3. Disconnect electrical power before servicing equipment.
4. All components must be properly grounded in accordance with local electrical safety requirements.
5. Operator safeguarding requirements must be addressed during final integration of the product.

**WARNING**: To minimize the possibility of electrical shock, bodily injury or death the following precautions must be followed.

1. Moving parts can cause crushing or shearing injuries. Access to all stage and motor parts must be restricted while connected to a power source.
2. Cables can pose a tripping hazard. Securely mount and position all system cables to avoid potential hazards.
3. Do not expose this product to environments or conditions outside of the listed specifications. Exceeding environmental or operating specifications can cause damage to the equipment.
4. The ATS150 stage must be mounted securely. Improper mounting can result in injury and damage to the equipment.
5. Use care when moving the ATS150 stage. Lifting or transporting the ATS150 stage improperly can result in injury or damage to the ATS150.
6. This product is intended for light industrial manufacturing or laboratory use. Use of this product for unintended applications can result in injury and damage to the equipment.
7. If the product is used in a manner not specified by the manufacturer, the protection provided by the product can be impaired and result in damage, shock, injury, or death.
8. Operators must be trained before operating this equipment.
9. All service and maintenance must be performed by qualified personnel.
EU Declaration of Incorporation

Manufacturer: Aerotech, Inc.
101 Zeta Drive
Pittsburgh, PA 15238-2811
USA

herewith declares that the product:
ATS150 Stage

is intended to be incorporated into machinery to constitute machinery covered by the Directive 2006/42/EC as amended; and that the following harmonized European standards have been applied:

EN ISO 12100:2010
Safety of machinery - Basic concepts, general principles for design
EN 60204-1:2010
Safety of machinery - Electrical equipment of machines - Part 1: General requirements

and further more declares that
it is not allowed to put the equipment into service until the machinery into which it is to be incorporated or of which it is to be a component has been found and declared to be in conformity with the provisions of the Directive 2006/42/EC and with national implementing legislation, i.e., as a whole, including the equipment referred to in this Declaration.

This is to certify that the aforementioned product is in accordance with the applicable requirements of the following Directive(s):

2011/65/EU RoHS 2 Directive

Authorized Representative: Simon Smith, European Director

<tr>
<td>ATS150 stages have limited protection against dust, but not water. This equates to an ingress protection rating of IP50.</td>
</tr>
<tr>
<td>Use</td>
</tr>
<tr>
<td>Indoor use only</td>
</tr>
</tbody>
</table>

1.2. Accuracy and Temperature Effects

Aerotech products are designed for and built in a 20°C (68°F) environment. Extreme temperature changes could cause a decrease in performance or permanent damage to the ATS150. At a minimum, the environmental temperature must be controlled to within 0.25°C per 24 hours to ensure the ATS150 specifications are repeatable over an extended period of time. The severity of temperature effects on all specifications depends on many different environmental conditions, including how the ATS150 is mounted. Contact the factory for more details.

If the stage is not equipped with an optional linear encoder, the accuracy of the screw is a key element in the overall positioning accuracy. A scale error can be expected if temperature of the screw differs from 20 °C (68 °F). The greater the temperature difference, the greater the error. The temperature of the screw depends on the speed and duty cycle of the stage. The faster the movement and higher the duty cycle, the more the stage accuracy will be affected by heat. The thermal expansion coefficient of the screw is 11.7 ppm/°C.

The temperature error, $t\varepsilon$, can be calculated with the formula that follows:

$$t\varepsilon = \alpha \times L \times \Delta t$$

where

- $\alpha = 11.7 \times 10^{-6}$ m/mm per °C (6.67 x 10-6 in/in per °F)
- $L$ = Length of ball screw between base and table top
- $\Delta t$ = temperature difference between ambient and 20° C (68° F)

If the stage has an optional linear encoder, the stage travel expands at a rate of the encoder scale (8.0 ppm/°C). Travel will increase or decrease at this rate as the temperature of the encoder scale deviates from 20 °C (68 °F).
### 1.3. Basic Specifications

**NOTE**: Aerotech continually improves its product offerings; listed options may be superseded at any time. All drawings and illustrations are for reference only and were complete and accurate as of this manual’s release. Refer to www.aerotech.com for the most up-to-date information.

</tbody>
</table>

1. Excessive duty cycle may impact stage accuracy.
2. Payload specifications are for single-axis systems and based on ball screw and bearing life of 2500 km (100 million inches) of travel.
3. Available with Aerotech controllers.

**NOTE**: Specifications are for single-axis systems; performance of multi-axis system is payload and workpoint dependent. Consult the Aerotech factory for multi-axis or non-standard applications.
1.4. Vacuum Operation

If the -HV option is ordered, Aerotech specially prepares the ATS150 for operation in high vacuum environments (up to $10^{-6}$ torr). This preparation involves special precautions during cleaning, assembly, and packaging to ensure optimal performance in vacuum applications.

To make sure that the ATS150 will continue to perform well in the vacuum environment, use the guidelines that follow (in addition to standard handling, installation, and lubrication guidelines outlined in this manual).

1. Do not remove the ATS150 from its sealed bag until it is ready to use.

2. Always handle the ATS150 in a clean environment and use powder-free polyethylene gloves to prevent any contaminants from adhering to the surface of the ATS150.

3. During installation, use cleaned, vented, stainless steel fasteners when securing the ATS150.

4. Reduced air pressure eliminates significant convective heat transfer. This, coupled with the viscous vacuum-compatible lubricants, could result in excessive motor operating temperatures. Because of this, consider all continuous torque ratings to be 40 to 60% lower than the value specified for operation in normal atmospheric environment. Reduce motor usage accordingly.

5. For vacuum applications, the recommended lubricant is a small quantity of Braycote® 602EF grease or a compatible substitute of equal quality.

6. Baking vacuum components between 100 and 125 °C for 24 to 48 hours significantly reduces outgassing at initial pump-down to vacuum pressure and evaporates water vapor that impregnates porous surfaces on the aluminum and Teflon cables. Aerotech recommends that customers bake out vacuum systems when first installing them in the vacuum chamber.
Chapter 2: Mechanical Specifications and Installation

**WARNING:** ATS150 installation must be in accordance to instructions provided by this manual and any accompanying documentation. Failure to follow these instructions could result in injury or damage to the equipment.

2.1. Unpacking and Handling the Stage

**WARNING:** It is the customer’s responsibility to safely and carefully lift the stage.
- Make sure that all moving parts are secure before moving the ATS150. Unsecured moving parts may shift and cause bodily injury.
- Improper handling could adversely affect the performance of the ATS150. Use care when moving the ATS150.

**NOTE:** If any damage has occurred during shipping, report it immediately.

Carefully remove the ATS150 from its protective shipping container. Gently set the ATS150 on a smooth, flat, and clean surface.

Before operating the ATS150, it is important to let it stabilize at room temperature for at least 12 hours. Allowing it to stabilize to room temperature will ensure that all of the alignments, preloads, and tolerances are the same as they were when tested at Aerotech. Use compressed nitrogen or clean, dry, oil-less air to remove any dust or debris that has collected during shipping.

Each ATS150 has a label listing the system part number and serial number. These numbers contain information necessary for maintaining or updating system hardware and software. Locate this label and record the information for later reference.
2.2. Dimensions

**NOTE**: Aerotech continually improves its product offerings; listed options may be superseded at any time. All drawings and illustrations are for reference only and were complete and accurate as of this manual’s release. Refer to www.aerotech.com for the most up-to-date information.

**Figure 2-1**: ATS150 Dimensions
2.3. Securing the Stage to the Mounting Surface

**WARNING:** Make sure that all moving parts are secure before moving the ATS150. Unsecured moving parts may shift and cause bodily injury.

**WARNING:** The ATS150 must be mounted securely. Improper mounting can result in injury and damage to the equipment.

The mounting surface must be flat and have adequate stiffness to achieve the maximum performance from the ATS150 stage. When it is mounted to a non-flat surface, the stage can be distorted while the mounting screws are tightened. This distortion will decrease overall accuracy. Adjustments to the mounting surface must be done before the stage is secured.

Inspect the mounting surface for dirt or unwanted residue and clean if necessary. Use precision flatstones on the mounting surface to remove any burrs or high spots. Clean the mounting surface with a lint-free cloth and acetone or isopropyl alcohol and allow the cleaning solvent to completely dry. Gently place the stage on the mounting surface.

**NOTE:** To maintain accuracy, the mounting surface must be flat to within 8 µm.

**NOTE:** The ATS150 is precision machined and verified for flatness prior to product assembly at the factory. If machining is required to achieve the desired flatness, it should be performed on the mounting surface rather than the ATS150. Shimming should be avoided if possible. If shimming is required, it should be minimized to retain maximum rigidity of the system.

ATS150 series stages have a fixed mounting pattern. To secure the stage to a mounting surface, manually move the stage table so that the access holes on the stage table are aligned with any two of the mounting holes on the under side of the stage (refer to Figure 2-2). Install the appropriately sized mounting screws through the access holes and secure the stage to the mounting surface. Repeat this process for each set of mounting holes.

**NOTE:** The stage table may offer a considerable amount of resistance when it is moved manually. This is especially true if the stage is fitted with a motor assembly.

**WARNING:** Do not attempt to manually move the ATS150 if it is connected to a power source.

Tightening torque values for the mounting hardware are dependent on the properties of the surface to which the stage is being mounted. Values provided in Table 2-1 are typical values and may not be accurate for your mounting surface. Refer to Section 2.2 for specific model mounting locations and dimensions.

2.4. Attaching the Payload to the Stage

Inspect the mounting surface for dirt or unwanted residue and clean if necessary. Clean the mounting surface with a lint-free cloth and acetone or isopropyl alcohol and allow the cleaning solvent to completely dry.

Aerotech recommends that customers use a representative payload during start-up to prevent accidental damage to the stage and the payload. Proceed with the electrical installation and test the motion control system in accordance with the system documentation. Document all results for future reference. For information on electrical installation refer to Chapter 3 and the documentation delivered with the stage.

**NOTE:** If your ATS150 was purchased with Aerotech controls, it might have been tuned with a representative payload based on the information provided at the time of order. If the ATS150 is started up without a payload, the servo gains provided by Aerotech with the shipment may not be appropriate and servo instability can occur. Refer to the controller help file for tuning assistance.

The payload must be flat, rigid, and comparable to the stage in quality to maintain optimum performance.

**NOTE:** For valid system performance, the mounting interface should be flat within 12 µm.

Applied loads should be symmetrically distributed whenever possible (i.e., the payload should be centered on the stage table and the entire stage should be centered on the support structure).

If cantilevered loads are applied, refer to Figure 2-3 to find the loading condition. Refer to Figure 2-4 to find the maximum allowable load.
Load capacity and life expectancy are inversely related (that is, as loading increases, life expectancy will decrease).
The ball screw is usually the critical component when determining life expectancy.

Figure 2-5 shows the travel life on the x-axis versus the loading percentage along the longitudinal axis (axis of travel) on the y-axis. To determine the approximate life expectancy in a given application, find the loading percentage and refer to the travel life diagram in Figure 2-5.

![Figure 2-5: Travel Life](image)

The procedure is as follows:

1. When the load is not cantilevered, divide the actual application load by the maximum horizontal load capacity. Multiply by 100 to get the percentage ratio.

2. When the application load is cantilevered, determine the length of the cantilever and find the corresponding maximum load (rated load) from Figure 2-4. Divide the actual load by this value and multiply by 100 to get the percentage ratio. For example, an application load weighs 10 pounds and is situated on a horizontal stage with a cantilever length of 6 inches. The rated load for this situation, read from the Lsc curve in Figure 2-4, is approximately 13 pounds. The percentage ratio is: $\frac{10}{13} \times 100 = 77\%$

3. Multiply the percentage ratio by the appropriate factor in the applied load coefficient table (Table 2-2).

4. Enter the y-axis of the travel life graph in Figure 2-5 at the calculated percentage and read the corresponding travel life from the x-axis. This diagram is based on approximately 100 million inches of

<table>
<thead>

</thead>
<tbody>
<tr>
<td>Smooth operation (no shocks)</td>
<td>1.0</td>
</tr>
<tr>
<td>Normal operating conditions</td>
<td>1.5</td>
</tr>
</tbody>
</table>
travel at the rated load. Loads exceeding the rated load (ratio more than 100 %) will reduce the rated life while loads with lower ratios will result in longer life. Be sure to consider dynamic loading when using the ATS150 series stage for high-speed applications.

The approximate amount of torque required to turn the ball screw of an ATS150 series stage can be found from Figure 2-6 or the following equation:

$$\text{Torque}_{\text{REQ}} = \frac{(\text{AxialLoad}) \times (\text{LeadofScrew})}{2 \times \pi \times (\text{Efficiency})}$$

For ATS150 series stages, the efficiency is rated at 90% (0.90). Refer to Figure 2-6.
Aerotech motion control systems are adjusted at the factory for optimum performance. When the ATS150 is part of a complete Aerotech motion control system, setup usually involves connecting the ATS150 to the appropriate drive chassis with the cables provided. Labels on the system components usually indicate the appropriate connections.

If system level integration was purchased, an electrical drawing showing system interconnects has been supplied with the system (separate from this documentation).

The electrical wiring from the motor and encoder are integrated at the factory. Refer to the sections that follow for standard motor wiring and connector pinouts.

### WARNING:
Electrical installation must be performed by properly qualified personnel.

### WARNING:
Applications requiring access to the stage while it is energized will require additional grounding and safeguards. The System Integrator or qualified installer is responsible for determining and meeting all safety and compliance requirements necessary for the integration of this stage into the final application.

### DANGER:
Remove power before connecting or disconnecting electrical components or cables. Failure to do so may cause electric shock or damage to the equipment.

### WARNING:
Operator access to the base and tabletop must be restricted while connected to a power source. Failure to do so may cause electric shock.

### NOTE:
If the ATS150 was not purchased as part of an integrated system, refer to the controller documentation to adjust servo gains for optimum velocity and position stability.
3.1. Motor and Feedback Connectors

Stages equipped with standard motors and encoders come from the factory completely wired and assembled.

**NOTE:** Refer to the other documentation accompanying your Aerotech equipment. Call your Aerotech representative if there are any questions on system configuration.

The protective ground connection of the ATS150 provides motor frame ground protection only. Additional grounding and safety precautions are required for applications requiring access to the stage while it is energized. The System Integrator or qualified installer is responsible for determining and meeting all safety and compliance requirements necessary for the integration of this stage into the final application.

- **DANGER:** Remove power before connecting or disconnecting electrical components or cables. Failure to do so may cause electric shock or damage to the equipment.
- **WARNING:** The protective ground connection must be properly installed to minimize the possibility of electric shock.
- **WARNING:** Operator access to the base and tabletop must be restricted while connected to a power source. Failure to do so may cause electric shock.
- **CAUTION:** The stage controller must provide over-current and over-speed protection. Failure to do so may result in permanent damage to the motor and stage components.

| Resistance, 25°C (Line-Line) | Ω | 1.0 |
| Inductance (Line-Line) | mH | 1.42 |
| Maximum Bus Voltage | $V_{DC}$ | 340 |
| Thermal Resistance | °C/W | 1.18 |
| Number of Poles | -- | 8 |

1. Performance is dependent upon heat sink configuration, system cooling conditions, and ambient temperature
2. All performance and electrical specifications ±10%
3. Values shown @ 105°C rise above a 25 °C ambient temperature, with housed motor mounted to a 250 mm x 250 mm x 6 mm aluminum heat sink
4. Peak torque assumes correct rms current; consult Aerotech
5. Torque constant and motor constant specified at stall
6. Maximum winding temperature is 130 °C
7. Ambient operating temperature range 0 °C - 25 °C; consult Aerotech for performance in elevated ambient temperatures
8. All Aerotech amplifiers are rated $A_{pk}$; use torque constant in N·m/$A_{pk}$ when sizing

1. 250 x interpolation + 4 x controller interpolation = 1000 x total
2. 1000 x interpolation + 4 x controller interpolation = 4000 x total
3. Quadrature decoding included in interpolated resolution calculations
3.4. Limits, Marker, and Machine Direction

Aerotech stages are configured to have positive and negative "machine" directions. The machine direction defines the phasing of the feedback and motor signals and is dictated by the stage wiring (refer to Section 3.5. for Motor and Feedback phasing information). Programming direction of a stage is set by the controller that is used to move the stage. Programming direction is typically selectable in the controller, while machine direction is hardwired in the stage. Figure 3-3 shows the machine direction of ATS150 stages.

Positive Machine Direction

+ Electrical Limit

Home Limit
(Near the center of travel)

- Electrical Limit

With the Foldback Motor Option, Positive and Negative limits swap, as does the Positive Machine Direction.

Figure 3-3: Machine Direction
3.5. Motor and Feedback Phasing

Motor phase voltage is measured relative to the virtual wye common point.

Figure 3-4: Hall Phasing

⚠️ With the Foldback Motor Option, Positive and Negative limits swap, as does the Positive Machine Direction.

Figure 3-4: Hall Phasing
Figure 3-5: Analog Encoder Phasing Reference Diagram

Figure 3-6: TTL Encoder Phasing Reference Diagram
Chapter 4: Maintenance

**NOTE:** If the bearing area is not kept free of foreign matter and moisture, the performance and life expectancy of the stage will be reduced.

**DANGER:** To minimize the possibility of bodily injury or death, disconnect all electrical power prior to performing any maintenance or making adjustments to the equipment.

### 4.1. Service and Inspection Schedule

Inspect the ATS150 at least once per month. A longer or shorter inspection interval may be required depending on the application and conditions, such as the duty cycle, speed, and environment.

In general, stages operating in a clean environment should be cleaned and lubricated annually or every 500 km (whichever comes first). For stages operating under conditions involving excessive debris, the stage should be cleaned every six months. For high-speed applications (those near max speed at a duty cycle of 50%), frequent maintenance with standard lubricants is required.

Monthly inspections should include but not be limited to:

- Visually inspect the stage and cables.
- Re-tighten loose connectors.
- Replace or repair damaged cables.
- Clean the ATS150 and any components and cables as needed.
- Repair any damage before operating the ATS150.
- Inspect and perform an operational check on all safeguards and protective devices.
4.2. Cleaning and Lubrication

When cleaning and/or lubricating components of the ATS150 series stages:

1. Be sure to use a clean, dry, soft, lint-free cloth for cleaning.
2. Before using a cleaning solvent on any part of the ATS150, blow away small particles and dust with clean, dry, compressed air.
3. Take the opportunity during the lubrication procedure to inspect the motion guides or bearings for any damage or signs of wear.
4. In applications that have multiple stages bolted together to form multi-axis systems, the orthogonality may be lost if the stage tables of the support stages are loosened. Precision aligned stages should not be loosened or disassembled.
5. Further disassembly of the stage is not recommended because proper assembly and calibration can only be done at the factory. In addition, an autocollimator is required for post assembly verification to maintain warranties. Contact Aerotech for more information.

**DANGER**: To minimize the possibility of bodily injury or death, disconnect all electrical power prior to performing any maintenance or making adjustments to the equipment.

**Cleaning**

If a solvent is necessary for cleaning the stage, Aerotech recommends using isopropyl alcohol. Harsher solvents, such as acetone, may damage the plastic and rubber seals on the ball screw and LMG trucks. If acetone is required, avoid contact the ball screw and bearing seals.

**WARNING**: Make sure that all solvent has completely evaporated before attempting to move the stage.

**Lubrication**

For standard ball screw, linear guides, and gearset assemblies, lubricate per grease label located next to the motor flange on the base. If no label is present, contact Aerotech for grease type.

For high-speed applications (i.e., near maximum speed at a duty cycle of 50%), frequent maintenance with standard lubricants is required.

If the application process uses only a small portion of travel for most of the duty cycle, periodically drive the stage through full travel to redistribute the lubrication in the bearings.
To lubricate the ATS150:

1. Drive the stage table to one end of travel and remove power to the stage.
2. Remove the screws on the edges of the hardcover and slide it out from the side opposite of the motor. This can be done without removing the table.
3. Remove any accumulated dust or debris from the inside of the assembly.
4. Remove any dirty or dried lubricant from the ball screw. Use a clean, lint-free cloth with a side-to-side motion. Manually turn the ball screw to clean its entire circumference. A swab soaked in isopropyl alcohol may be used to remove stubborn debris.
5. Clean the end of the ball-screw nut and wiper with a clean, lint-free cloth or swab.
6. Clean the linear bearing guides using a similar technique.
7. Apply a thin, continuous film of lubricant to the ball-screw threads and linear bearing guides. A natural bristle brush is an excellent applicator.
8. For stages without an optional brake, manually move the stage to the opposite end of travel. This will work the grease into the ball screw and linear bearing guides. If the stage has an optional brake, the stage cannot be moved by hand. In this case, restore power to the stage, drive it to the desired position, then remove power and continue to Step 9. Be sure to use extreme caution while operating the stage temporarily without the hardcover installed.
9. Repeat steps 3 through 7 for any areas covered by the original table position.
10. Refasten the hardcover. Torque the hardcover screws to 36 - 42 in-lbs to ensure proper support.
11. Restore power to the stage, and drive the stage table back to its original position to redistribute lubricants.
### 4.3. Troubleshooting

<table>
<thead>
<tr>
<th>Symptom</th>
<th>Possible Cause and Solution</th>
</tr>
</thead>

Appendix A: Warranty and Field Service

Aerotech, Inc. warrants its products to be free from harmful defects caused by faulty materials or poor workmanship for a minimum period of one year from date of shipment from Aerotech. Aerotech’s liability is limited to replacing, repairing or issuing credit, at its option, for any products that are returned by the original purchaser during the warranty period. Aerotech makes no warranty that its products are fit for the use or purpose to which they may be put by the buyer, whether or not such use or purpose has been disclosed to Aerotech in specifications or drawings previously or subsequently provided, or whether or not Aerotech’s products are specifically designed and/or manufactured for buyer’s use or purpose. Aerotech’s liability on any claim for loss or damage arising out of the sale, resale, or use of any of its products shall in no event exceed the selling price of the unit.

THE EXPRESS WARRANTY SET FORTH HEREIN IS IN LIEU OF AND EXCLUDES ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED, BY OPERATION OF LAW OR OTHERWISE. IN NO EVENT SHALL AEROTECH BE LIABLE FOR CONSEQUENTIAL OR SPECIAL DAMAGES.

Return Products Procedure

Claims for shipment damage (evident or concealed) must be filed with the carrier by the buyer. Aerotech must be notified within thirty (30) days of shipment of incorrect material. No product may be returned, whether in warranty or out of warranty, without first obtaining approval from Aerotech. No credit will be given nor repairs made for products returned without such approval. A "Return Materials Authorization (RMA)" number must accompany any returned product(s). The RMA number may be obtained by calling an Aerotech service center or by submitting the appropriate request available on our website (www.aerotech.com). Products must be returned, prepaid, to an Aerotech service center (no C.O.D. or Collect Freight accepted). The status of any product returned later than thirty (30) days after the issuance of a return authorization number will be subject to review.

Returned Product Warranty Determination

After Aerotech’s examination, warranty or out-of-warranty status will be determined. If upon Aerotech’s examination a warranted defect exists, then the product(s) will be repaired at no charge and shipped, prepaid, back to the buyer. If the buyer desires an expedited method of return, the product(s) will be shipped collect. Warranty repairs do not extend the original warranty period.

- **Fixed Fee Repairs** - Products having fixed-fee pricing will require a valid purchase order or credit card particulars before any service work can begin.

- **All Other Repairs** - After Aerotech’s evaluation, the buyer shall be notified of the repair cost. At such time the buyer must issue a valid purchase order to cover the cost of the repair and freight, or authorize the product(s) to be shipped back as is, at the buyer’s expense. Failure to obtain a purchase order number or approval within thirty (30) days of notification will result in the product(s) being returned as is, at the buyer’s expense.

Repair work is warranted for ninety (90) days from date of shipment. Replacement components are warranted for one year from date of shipment.
Rush Service

At times, the buyer may desire to expedite a repair. Regardless of warranty or out-of-warranty status, the buyer must issue a valid purchase order to cover the added rush service cost. Rush service is subject to Aerotech's approval.

On-site Warranty Repair

If an Aerotech product cannot be made functional by telephone assistance or by sending and having the customer install replacement parts, and cannot be returned to the Aerotech service center for repair, and if Aerotech determines the problem could be warranty-related, then the following policy applies:

Aerotech will provide an on-site Field Service Representative in a reasonable amount of time, provided that the customer issues a valid purchase order to Aerotech covering all transportation and subsistence costs. For warranty field repairs, the customer will not be charged for the cost of labor and material. If service is rendered at times other than normal work periods, then special rates apply.

If during the on-site repair it is determined the problem is not warranty related, then the terms and conditions stated in the following "On-Site Non-Warranty Repair" section apply.

On-site Non-Warranty Repair

If any Aerotech product cannot be made functional by telephone assistance or purchased replacement parts, and cannot be returned to the Aerotech service center for repair, then the following field service policy applies:

Aerotech will provide an on-site Field Service Representative in a reasonable amount of time, provided that the customer issues a valid purchase order to Aerotech covering all transportation and subsistence costs and the prevailing labor cost, including travel time, necessary to complete the repair.
